

SmokeStop™ Evac Kit

SmokeStop™ Evac Kit’s hands-free design delivers “smoke-free surgery room” compliance in hospitals and ASCs implemented by state laws.

SmokeStop works in conjunction with standard fluid medical waste suction devices making it easy to use and more cost effective than competitors standalone systems.

Designed by Surgeons for Surgeons

Performance, Functionality, and Value:

SmokeStop’s compact design delivers surgical smoke evacuation directly at the incision site, precisely where needed; effectively and efficiently removing toxic smoke plumes without compromising the surgeon’s visibility or sterile field workspace.

- **SmokeStop™ Evac Kit (sterile) includes:** Two landing pads, two mini-vac suction tips with fastening tabs, and two suction tubes for easy connection to standard fluid medical waste suction devices
- **Customized placement:** SmokeStop’s sterile landing pad and mini-suction tips can be safely placed close to the incision site, enabling effective smoke plume capture and enhanced workflow efficiency. (**CDC/NIOSH suggest smoke-evacuator tip placement must be kept within 2 inches from incision site to effectively capture surgical smoke plume*)
- **Cost effective solution:** No additional electrical suction device required; reducing costly equipment maintenance and management.
